

Ian Jungmann

7414 Coronado Ave, Apt. 7
Dallas, TX, 75214

Email: ian@jungmann.us
Phone: (817) 908-3303

Education:

The University of Texas at Arlington, Arlington, Texas
B.S. **Computer Science**
Graduation: May 2014

Experience:

Artisan Studios

Senior Software Developer: August 2023 - May 2025

- Enhanced Suggested Ordering **applications** as part of Chick-fil-A team.
- Worked on AWS Marketplace **integration** of new Edge **product**
- **Key technologies:** **Java**, Golang, many AWS **services**, Postgres

Pieces Technologies, Irving, Texas

Senior Software Developer: January 2022 - August 2023

- Enhanced Pieces Connect **product**
 - Designed, led, and helped implement webforms project
- Created new Pieces Predict Epic **integration** project
 - Designed, led, and implemented backend portion
- **Key technologies:** **Java**, Spring Boot, MySQL, **Elasticsearch**, Kafka, WSO2

Hedera Hashgraph, Richardson, Texas

Senior Software Developer: July 2020 - January 2022

- Designed, maintained, and enhanced the Mirror Node project
- **Key technologies:** **Java**, Spring Boot, PostgreSQL, NodeJS, Docker, Kubernetes, Helm

Spireon Inc., Irving, Texas

Senior Software Developer: July 2017 – July 2020

- Designed, developed, and maintained **Java** Spring Boot **microservices** as part of Platform **API** team
- **Key technologies:** **Java**, Spring, Spring Boot, Kafka, Docker, MySQL

Sabre Holdings, Southlake, Texas

Contributor Software Developer: June 2014 – July 2017

Intern Java Developer: May 2013-August 2013

Computer Skills:

Languages: **Java**, **Javascript**/Node, Golang

Tools/Frameworks: Spring Boot, Relational and NoSQL databases, Docker, Kubernetes, CI/CD tools, messaging **services** (SQS, Kafka), **monitoring services** (Datadog, Kibana)

Certifications: AWS Solutions Architect - Associate

Ian Jungmann

Notable Projects:

Suggested Ordering Service [Artisan Studios, August 2023 - December 2024]: Helped **design**, develop, maintain, and monitor the Suggested Ordering Service. This service was a supply chain tool that restaurants would use to help determine how much of various items they should order from their suppliers based on a number of factors such as current stock, forecasted sales, and safety (extra) stock. This service was composed of multiple Spring Boot **applications** that connected via AWS MSK and SQS. Each service was connected to an RDS (Postgres) **database**. Other technologies used include S3, Athena, Redshift, and DynamoDB. Datadog **monitoring** and alerts were implemented and fine-tuned to ensure the **production** environment was stable at all times.

Pieces Predict Epic **Integration** [Pieces, August 2022 - August 2023]: Designed, led, and helped implement a new version of the Predict application that could be embedded within various Epic products. Epic is a leading healthcare technology provider, and their products are used in many hospitals. This project required us to authenticate with Epic via OAuth 2.0, to send **data** back to Epic through various APIs, and to have our application embedded within an iFrame on their products. Several **microservices** were used, with Kafka as the messaging broker between them. **Data** was stored both in MySQL and **Elasticsearch**. This project required a lot of communication both with Epic and with the hospital that agreed to be our first **customer**. The first version of the **product** was released on **time** and has received great praise, and new features are actively being developed. The backend was written in **Java** with Spring Boot.

Pieces Connect Webforms [Pieces, April 2022 - July 2022]: Designed, helped implement the backend, and led a team to enhance Pieces Connect to allow case managers to send medical forms to patients and track their status, and to allow patients to fill out the forms online. This required particular attention to **security** to address HIPPA concerns. The application was required to be able to send links to the forms via SMS and email. The **code** was designed in a way to be easily enhanceable for future projects. The project was delivered on **time** and with all requirements met. Primary technologies included **Java** (Spring Boot), Twilio, and JavaMail.

Mirror Node Non-Fungible Token (NFT) Support [Hedera, March 2021 - Sep. 2021]: Designed new functionality for the Hedera Mirror Node that would allow nodes to handle and display NFT **data**. This included **Java code** for the parser to handle the new Protobuf, new tables in our Postgres **database**, and **Javascript code** to handle new REST APIs to display information about the NFTs. Worked directly with the **Services** team to understand the intended **design** and help troubleshoot issues as they arose. Primary technologies involved were **Java**/Spring Boot, NodeJS, and PostgreSQL.

Fuel Card **Management** System [Spireon, August 2018 – July 2020]: Designed and led a team of 4 developers in creating new **microservices** to process transaction **data** from various fuel card suppliers and use it to generate reports for fleet managers regarding fuel efficiency, prices, and potential fraud concerns. This involved frequent discussions with project managers, working with the **data** team for Snowflake **integration**, working with the fleet development team to integrate our **services** into their application, and more. The **services** were primarily Spring Boot **applications**, technologies involved include MySQL, Kafka, Quartz jobs, and others. The application is built into a Docker image and deployed to K8s on AWS.

Summary

I am a **senior software engineer** currently working at Artisan Studios. My primary focus at this moment is on backend development, specializing in developing **Java** REST APIs, although I have worked on more **data processing** heavy **applications** and various **microservices** as well. For most of my career the projects I have worked on were written in **Java** (with a variety of frameworks and libraries, Spring especially), but I have also done some work with Node.js, I have written a few small scripts in **Python**, I have a basic understanding of Golang, and I am always willing and able to learn new languages and tools. I've worked with various databases (MySQL, Postgres, **Elasticsearch**, Redis, Mongo), messaging **services** (Kafka, RabbitMQ), build tools (Gradle, Maven), and a variety of other tools over the years. I've worked in teams of all sizes, I've been responsible for designing, implementing, and maintaining **applications**, and I've worked in both scrum and kanban teams. In fact, I did a short stint as a scrum master during a transition phase. I pride myself on doing my **best** to put the success of the team above all else. I work closely with project managers during requirements **analysis** to make sure needs are being addressed and priority is understood. I advocate for designing with the future in mind, and I'm especially focussed on how REST endpoints and **data** structures are being handled. I take retros very seriously, and I do my **best** to foster an environment where team members feel safe expressing their thoughts. I meet consistently with other engineers and teams to see what processes and systems we can improve, what tech debt we have, and how our work will affect other teams. I also believe in making documentation a priority, and writing **code** that is efficient, maintainable, and readable. That being said, I also understand the need for speed in development sometimes, and I will always take that into consideration. I am proud of the work I have done thus far in my career, and the things my teams have accomplished during that **time**.

Work History

Total Work Experience: 11 years

- **Senior Software Engineer** Artisan Studios
Aug 01, 2023
- **Senior Software Engineer** Pieces Technologies
Jan 01, 2022
- **Senior Software Engineer** Hedera Hashgraph
Jun 01, 2020
- **Senior Software Engineer** Spireon
Jun 01, 2017
- **Software Engineer** Sabre
Jun 01, 2014

Education

- **Bachelors** | University of Texas at Arlington

Skills

- **java** - 11 years
- **software development** - 7 years
- **apache kafka** - 6 years
- **api** - 6 years
- **hibernate** - 6 years
- **mysql** - 6 years
- **elasticsearch** - 5 years
- **postgresql** - 4 years
- **amazon web services** - 2 years
- **go** - 2 years
- **datadog** - 1 years
- **javascript** - 1 years
- **kibana** - 1 years
- **nosql** - 1 years
