

DAVID OJO

+1 (267) 632-7858 | conceptcodes@gmail.com | Dallas, Tx, USA | github.com/conceptcodes

PROFESSIONAL SUMMARY

Full-Stack Engineer specializing in **Node.js, Python, and Java** who architects low-latency micro-services, real-time data visualizations, and intuitive front-ends with **React and TypeScript**. Designs cloud-native **REST/GraphQL APIs** and resilient database layers that scale to millions of users, leveraging **Docker, Kubernetes, and AWS/GCP**. Passionate about embedding **AI/ML** to elevate product intelligence and championing clean, modular code bases. Excels at translating complex business goals into high-impact features through close collaboration with product and stakeholder teams.

SKILLS

Skills: Javascript/Typescript, Python, Java, Go, MongoDB, Docker, Apache Kafka, Kubernetes, gRPC, Redis, Postgres, Jest, Node.js, React.js, React Native, AWS, GCP, Agile, SCRUM, Protobuf, Team Collaboration, Leadership, Datadog, Playwright, Event-Driven Architecture, MongoDB, Microfrontend Architecture, Code Reviews, Jest, Restful API's, Cross-functional Collaboration, System Design

PROFESSIONAL EXPERIENCE

LockTera <i>Senior Software Engineer Contractor</i>	Dallas, TX, USA <i>June 2025 - Present</i>
---	--

- Refactored 14 key components and added Vitest + Playwright tests.
- Collaborated cross-functionally with internal and backend teams to deliver secure, high-performance solutions for clients across industries such as legal, healthcare, and government.
- Introduced and championed unit testing and debugging best practices, improving code quality and stability for scalable enterprise applications.
- Provided architectural guidance on codebase structure, leveraging prior experience from larger organizations to foster long-term scalability and maintainability.

Divisions Maintenance Group <i>Software Development Engineer 2</i>	Remote <i>December 2021 - April 2025</i>
--	--

- Engineered modern web applications using Java (Spring Boot) and TypeScript (React), with PostgreSQL and MongoDB, reducing average response time by 20% by implementing a caching/sync layer and building indexers/state machines for our listing endpoints.
- Architected and documented scalable API contracts, collaborating closely with product managers to translate business requirements into technical specifications, reducing development cycle time by 30%. Ensured seamless integration by maintaining up-to-date Postman collections with examples and mocking APIs for frontend teams.
- Developed real-time monitoring dashboards for API health and user analytics, providing the National Account team with a clearer regional picture and enabling rapid report sharing via stateful URLs, enhancing data-driven decision-making and proactive issue resolution.
- Demonstrated proactive leadership and took ownership of critical initiatives, effectively stepping into an SDE3 role by suggesting and implementing architectural enhancements to the system, and actively contributing to code reviews.

PROJECTS & OUTSIDE EXPERIENCE

AI Order Entry Agent - [Link to project](#)

- Built a voice-driven order entry system using LangChain and OpenAI GPT-4, designed to simulate human-like fast food ordering over a multi-turn conversation
- Engineered a resilient AI workflow by modeling the agent around a stateful decision tree with embedded product knowledge and modifier logic, ensuring natural and accurate responses.
- Addressed key technical challenges including managing conversational state, real-time audio transcription, and integrating streaming voice input and routing for seamless interaction with session tracking and confirmation flows.
- Built the entire backend in TypeScript, leveraging Langchain's Langgraph Typescript SDK, and successfully demoed the system during an AI talk presented at the Dallas Software Developers group.
- <https://github.com/ConceptCodes/ai-order-entry>

Deep Research UI - [Link to project](#)

- Developed a browser-based AI research assistant using Next.js and TypeScript that automates multi-step research workflows with LangGraph and LangChain.js, enabling users to quickly conduct deep dives into topics and save hours on traditional research.
- Innovated a cost-effective alternative to premium AI subscriptions, with each research query costing less than \$1 and encouraging users to utilize their own API keys.
- Addressed complex technical challenges by integrating the Tavily search API and OpenAI models to plan topics, conduct web searches, and generate structured Markdown reports.
- Implemented a crucial content review stage to ensure information sufficiency, allowing the AI to prompt for follow-up questions when necessary and delivering cited information for reliable follow-up.
- Designed the application for local-first deployment, extendable to LangGraph Studio for visual research orchestration, and ensured maintainability through clear documentation and modular design.
